# ProQuest 资源应用举例

## A meta-analytic review of the association between perceived social support and depression in childhood and adolescence

5. Longitudinal associations between social support and depression require further study. Most informative would be investigations of complex models (e.g., cross-panel and growth models) using multiple time points, and guided by theories that can elucidate potential bidirectional influences of social support and depression.
6. Future research should carefully consider the psychometric properties of instruments. The use of tools with strong psychometric properties will reduce error and allow potential associations between support and depression, and moderation, to emerge more clearly.

One final recommendation that can help facilitate future meta-analytic reviews: Provide zero-order correlations among all constructs in the study or statistics that can be used to calculate an overall effect size. Correlations by gender or developmental level of the sample, or multiple time points could be provided, as well as correlations by source and type if social support instruments allow for subscale scores. Even if a study does not focus on these subgroups in the main analyses, these disaggregated effect sizes could facilitate comparisons in future meta-analyses. Although space limitations may prohibit inclusion of such large correlation tables in a report, these could be included as an appendix or an electronic supplemental resource (e.g., Pössel, Rudasill, Sawyer, Spence, & Bjerg, 2013) or conducted and saved for future availability.

### Conclusions

### References

References marked with an asterisk indicate studies included in the meta-analysis.

# ProQuest 资源应用举例

## A meta-analytic review of the association between perceived social support and depression in childhood and adolescence

5. Longitudinal associations between social support and depression require further study. Most informative would be investigations of complex models (e.g., cross-panel and growth models) using multiple time points, and guided by theories that can elucidate potential bidirectional influences of social support and depression.
6. Future research should carefully consider the psychometric properties of instruments. The use of tools with strong psychometric properties will reduce error and allow potential associations between support and depression, and moderation, to emerge more clearly.

One final recommendation that can help facilitate future meta-analytic reviews: Provide zero-order correlations among all constructs in the study or statistics that can be used to calculate an overall effect size. Correlations by gender or developmental level of the sample, or multiple time points could be provided, as well as correlations by source and type if social support instruments allow for subscale scores. Even if a study does not focus on these subgroups in the main analyses, these disaggregated effect sizes could facilitate comparisons in future meta-analyses. Although space limitations may prohibit inclusion of such large correlation tables in a report, these could be included as an appendix or an electronic supplemental resource (e.g., Pössel, Rudasill, Sawyer, Spence, & Bjerg, 2013) or conducted and saved for future availability.

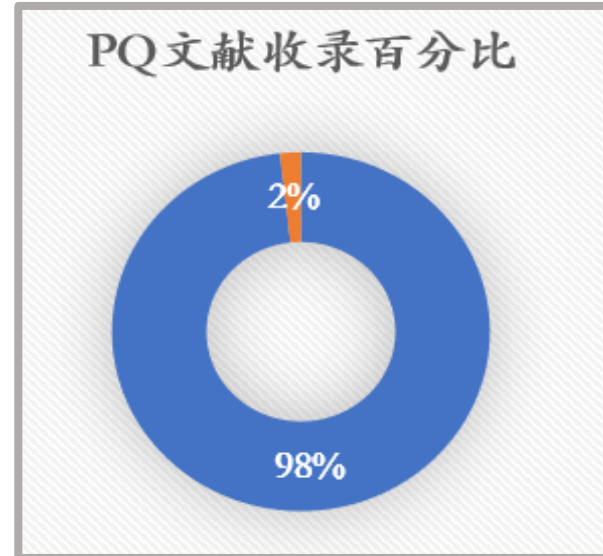

### Conclusions

VI. LIMITATIONS & FUTURE RESEARCH

There were several limitations in this study. First and foremost, the infancy of CAV technology makes accurate data difficult to collect and thus any related research agenda very speculative. The specific research enacted in this paper – the use of VISSIM to conduct a scenario analysis of the impacts of DCAVLs on freeway performance – is a topic that has not been addressed in current literature largely for this reason. The CoEXist team has provided the only current driving behavior model for CAVs that is integrated with Vissim (Sukennik, 2018). This recent development has served as a massive opportunity for researchers to begin creating complicated microsimulations involving CAVs. However, data limitations make this model practically impossible to calibrate or verify. For these reasons, the infancy of the technology has been a major limitation on this study.

Another limitation was the inevitable legal issues CAVs will face regarding the following of speed limits. As of right now, it is impossible to predict how legislature will be passed to resolve this issue. For the sake of this paper, CAVs were assumed to be allowed to exceed speed limits and thus would follow similar desired speed distributions as traditional vehicles. Whether this is realistic is unclear and unanswerable. Future researchers could easily face this limitation with an entirely different approach. Nonetheless, these legal issues presented distinct limitations

摘要

翻译

Purpose

The last decades have witnessed an increased interest in urban logistics originating from both the research and the practitioners' communities. Sustainable freight transports today are on the political, social and technological agenda of many actors operating in urban contexts. Due to the extent of the covered areas and the continuous progress in many fields, the resulting body of research on urban logistics appears quite fragmented. From an engineering management perspective, the purpose of this paper is to present a systematic literature review (SLR) that aims to consolidate the knowledge on urban logistics, analyse the development of the discipline, and provide future research directions.

Design/methodology/approach

The paper discusses the main evidence emerging from a SLR on urban logistics. The corpus resulting from the SLR has been used to perform a citation

### 描述

This book examines the Internet of Things (IoT) and Data Analytics from a technical, application, and business point of view. Internet of Things and Data Analytics Handbook describes essential technical knowledge, building blocks, processes, design principles, implementation, and marketing for IoT projects. It provides readers with knowledge in planning, designing, and implementing IoT projects. The book is written by experts. 显示更多

amount of leakage that can
- 第471页  
测试

1. The current annual real losses (CARL)
2. The economic level of leakage (ELL)
3. Unavoidable annual real losses (UARL)
4. Four arrows representing how real losses occur (shown in Figure 28.3)

The CARL, ELL, and UARL are shown in the center box in Figure 28.3. The CARL is quantified through a water audit, and a control can reduce the CARL. The M36 Manual defines the amount of leakage that can be avoided through leakage control measures whose costs are balanced against the savings of reducing ELL [2].” The UARL is a reference low level derived from data provided by water utilities able to achieve excellent leakage control and is for calculating the performance indicator called infrastructure leakage index (ILI). The calculation for UARL includes specific information about the water system attributes to make the determination.

**标注颜色、文字**

The M36 manual describes a similar four-pillar conceptual approach to the control of apparent losses. The four pillars to control apparent loss include:

1. Current volume of apparent losses listed in the water audit
2. Utility-specific target for apparent losses or economic level of apparent losses (ELAL)

# 内容复制 (引用)

FIGURE 28.4 Four-pillar approach to control apparent losses [2]. Reproduced with permission from the M36 manual, H2M.

The current volume of apparent losses listed in the water audit, the ELAL and the UAAL, is shown in the center box of Figure 28.4. The M36 manual defines the ELAL as “the level at which the cost of the loss control efforts equals the savings garnered from the loss recovery,”

and the UAAL as “a conceptual level of loss control that would be attained if all possible loss controls could be implemented that the UAAL is unavoidable and does not have a formula. The four arrows surrounding the box are intended to indicate that control in each component of loss will result in an equal volume of apparent losses.
